# Point Cloud Library

*Release 0.0*

**unknown**

**May 28, 2023**

# CONTENTS

1	Developing PCL code	3
2	Committing changes to the git master	5
3	Improving the PCL documentation	7
4	How to build a minimal example	9

The following presents a set of advanced topics regarding PCL.

PCL uses modern C++ template programming in order to achieve maximum generality and reusability of its components. Due to intricate details of the current generation of C++ compilers however, the usage of templated code introduces additional compile-time delays. We present a series of tricks that, if used appropriately, will save you a lot of headaches and will speed up the compilation of your project.

- `c_cache`

*CcCache* is a compiler cache. It speeds up recompilation by caching previous compilations and detecting when the same compilation is being done again. Supported languages are C, C++, Objective-C and Objective-C++.

	Elapsed time	Percent	Factor
Without ccache	367.11 s	100.00 %	1.0000 x
ccache 3.0 direct, first time	385.67 s	105.06 %	0.9519 x
ccache 3.0 direct, second time	9.70 s	2.64 %	37.8464 x
ccache 3.0 prepr., first time	382.26 s	104.13 %	0.9604 x
ccache 3.0 prepr., second time	23.90 s	6.51 %	15.3603 x

- `distc`

*distcc* is a program to distribute builds of C, C++, Objective C or Objective C++ code across several machines on a network. *distcc* should always generate the same results as a local build, is simple to install and use, and is usually much faster than a local compile.

Host	Slot	File	State	Tasks
localhost	1	fork.c	Compile	
nevada	0	ialloc.c	Compile	
nevada	1	cruc32.c	Compile	
nevada	2	vm86.c	Compile	
nevada	3	datagram.c	Preprocess	
proforma	0	loop.c	Compile	
proforma	1	slab.c	Receive	
proforma	2	pageattr.c	Preprocess	

Load average: 3.31, 1.96, 1.83

- `compiler_optimizations`

Depending on what compiler optimizations you use, your code might behave differently, both at compile time and at run time.

`-O` turns on the following optimization flags:

```
-fauto-inc-dec
-fcompare-elim
-fcprop-registers
-fdce
-fdefer-pop
-fdelayed-branch
-fdse
```

- `single_compile_unit`

In certain cases, it's better to concatenate source files into single compilation units to speed up compiling.

```
1 #include "../Dialog/Dialog.cpp"
2 #include "../Dialog/ModalDialog.cpp"
3 #include "../GDI/Brush.cpp"
4 #include "../GDI/Font.cpp"
5 #include "../Helper/Thread.cpp"
6 #include "../Window/MDIChildWindow.cpp"
7 #include "../Window/MDIParentWindow.cpp"
8 #include "../Window/SDIWindow.cpp"
```

## DEVELOPING PCL CODE

To make our lives easier, and to be able to read and integrate code from each other without causing ourselves headaches, we assembled a set of rules for PCL development that everyone should follow:

### Rules

- if you make important commits, please **\_add the commit log\_** or something similar **\_to the changelist page\_** (<https://github.com/PointCloudLibrary/pcl/blob/master/CHANGES.md>);
- if you change anything in an existing algorithm, **\_make sure that there are unit tests\_** for it and **\_make sure that they pass before you commit\_** the code;
- if you add a new algorithm or method, please **\_document the code in a similar manner to the existing PCL code\_** (or better!), and **\_add some minimal unit tests\_** before you commit it;
- method definitions go into (include/.h), templated implementations go into (include/impl/.hpp), non-templated implementations go into (src/.cpp), and unit tests go in (test/.cpp);
- last but not least, please **\_respect the same naming and indentation guidelines\_** as you see in the `pcl_style_guide`.

- `pcl_style_guide`

Please follow the following naming and indentation rules when developing code for PCL.

- `exceptions_guide`

Short documentation on how to add new, throw and handle exceptions in PCL.

- `pcl2`

An in-depth discussion about the PCL 2.x API can be found [here](#).

## **COMMITTING CHANGES TO THE GIT MASTER**

In order to oversee the commit messages more easier and that the changelist looks homogenous please keep the following format:

“\* <fixed|bugfix|changed|new> X in @<classname>@ (#<bug number>)”

## IMPROVING THE PCL DOCUMENTATION

- `how_to_write_a_tutorial`

In case you want to contribute/help PCL by improving the existing documentation and tutorials/examples, please read our short guide on how to start.

## HOW TO BUILD A MINIMAL EXAMPLE

- `minimal_example`

In case you need help to debug your code, please follow this guidelines to write a minimal example.
